Business Requirements Document

Aurora Insights — Retrieval-Augmented Generation (RAG) Application for Annual Business Reports

Field	Detail	Field	Detail
Document ID	BRD-AI-RAG-001	Version	1.0 (Draft)
Author	Business Analysis Team	Date	15 June 2026
Sponsor	VP, Finance Technology	Status	For Review
Classification	Confidential (Sample)	Source Data	FY2024 & FY2025 Reports

1. Introduction & Purpose

This Business Requirements Document (BRD) defines the business need, scope, stakeholders, and requirements for “Aurora Insights,” a Retrieval-Augmented Generation (RAG) application. The application enables business users to ask natural-language questions and receive accurate, source-cited answers grounded in the organisation’s annual business reports.

The initial knowledge base comprises two documents previously produced as samples: the Aurora Dynamics Inc. Annual Business Report for FY2025 and FY2024. The solution must read, index, and reason over the content of these reports — including executive summaries, KPIs, income-statement tables, balance-sheet highlights, and segment performance — so that users can retrieve facts and compare results across years without manually searching the PDFs.

1.1 Background

Finance and leadership teams currently locate figures by manually opening and scanning multi-page PDF reports. This is slow, error-prone, and difficult to audit. A RAG application addresses this by combining semantic search over the report content with a large language model that generates concise, grounded answers and always cites the underlying source passages.

2. Business Objectives

- **Reduce research time —** Cut the time to answer a financial query from minutes of manual searching to seconds.
- **Improve accuracy —** Ground every answer in the actual report content and surface the exact source passage.
- **Enable comparison —** Support year-over-year questions across the FY2024 and FY2025 reports.
- **Ensure traceability —** Provide citations for audit and compliance confidence.
- **Scale the knowledge base —** Allow future reports and filings to be added without re-engineering.

3. Scope

3.1 In Scope

- • Ingestion and indexing of the FY2024 and FY2025 annual business report PDFs.
- • Natural-language question answering with source citations.
- • Year-over-year comparison of revenue, profit, margins, KPIs and segments.
- • A web-based chat interface and a backend API.
- • Access control, logging, and answer-grounding guardrails.

3.2 Out of Scope

- • Automated generation or editing of financial reports.
- • Real-time market data or external data feeds (future phase).
- • Financial advice, forecasting, or investment recommendations.
- • Integration with ERP/accounting systems (future phase).

4. Stakeholders

Stakeholder	Role	Primary Interest

Finance & FP&A Analysts	Primary users	Fast, accurate retrieval of figures and trends
Executive Leadership	Decision-makers	High-level KPI and performance summaries
Investor Relations	Users	Consistent messaging drawn from reported figures
Internal Audit & Compliance	Reviewers	Traceable, source-cited answers
IT / Platform Team	Implementers	Secure, maintainable, scalable architecture
Project Sponsor	Approver	Business value and ROI

5. Business Architecture

The business architecture describes how stakeholders, the RAG-enabled business capabilities, and the underlying information assets combine to deliver measurable outcomes. Stakeholders consume capabilities (such as self-service Q&A and year-over-year comparison); those capabilities draw on the annual report knowledge base; and the result is faster decisions, less manual effort, consistent answers, and stronger governance.

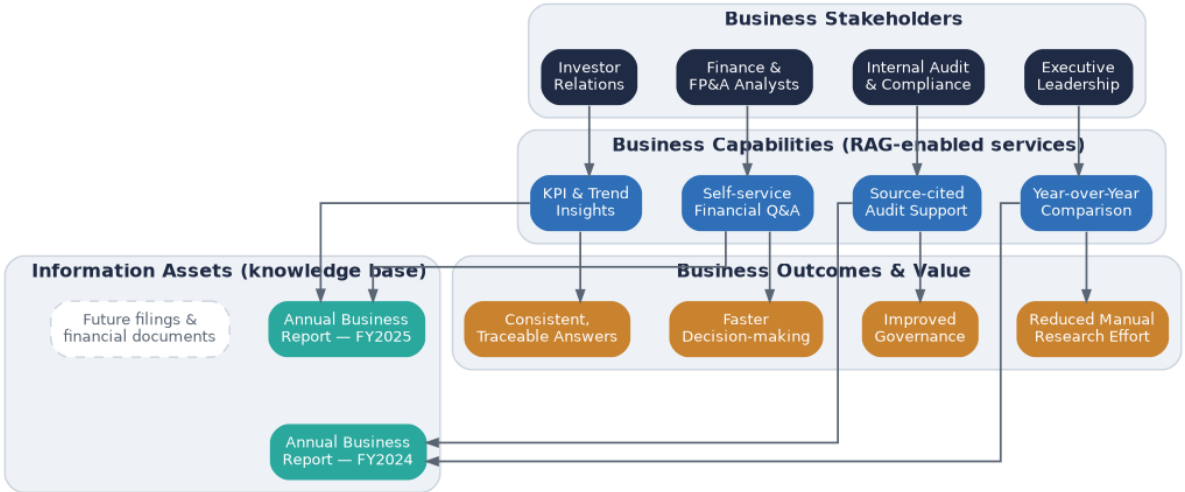

Figure 1. Business architecture — stakeholders, capabilities, information assets, and outcomes.

6. Functional Requirements

ID	Requirement	Priority
FR-01	The system shall ingest PDF annual reports and extract text, tables, and metadata (company, fiscal year, section).	Must
FR-02	The system shall split documents into retrievable chunks and store vector embeddings.	Must
FR-03	Users shall ask natural-language questions through a chat interface.	Must
FR-04	The system shall retrieve the most relevant passages and generate a grounded answer.	Must
FR-05	Every answer shall include citations identifying the source report, year, and section.	Must
FR-06	The system shall answer year-over-year comparison questions across FY2024 and FY2025.	Must
FR-07	The system shall decline or flag questions it cannot ground in the source content.	Must
FR-08	Administrators shall add new documents to the knowledge base without code changes.	Should
FR-09	The system shall retain conversation context within a session.	Should
FR-10	Users shall provide feedback (thumbs up/down) on answer quality.	Could

7. Non-Functional Requirements

Category	Requirement	Target
Performance	End-to-end answer latency	≤ 5 seconds (typical query)
Accuracy	Answers grounded in retrieved source	≥ 95% grounded / cited
Availability	Service uptime	99.5% monthly
Security	Access control & data protection	Role-based access; encryption at

		rest/in transit
Scalability	Knowledge base growth	Support 100+ documents without redesign
Auditability	Logging of queries and sources	All queries and citations logged
Usability	Learnability for finance users	Usable with no training

8. Technical Architecture

The technical architecture follows a standard RAG pattern with two flows. An offline ingestion pipeline loads the PDF reports, parses and chunks the content, tags metadata, generates embeddings, and writes vectors to a vector database alongside a metadata/document store. An online flow handles user queries in real time: the orchestrator embeds the query, retrieves and re-ranks the most relevant passages, assembles a grounded prompt, and calls the LLM to generate a cited answer returned through the API and chat UI. Cross-cutting concerns — security, grounding guardrails, and monitoring — apply across both flows.

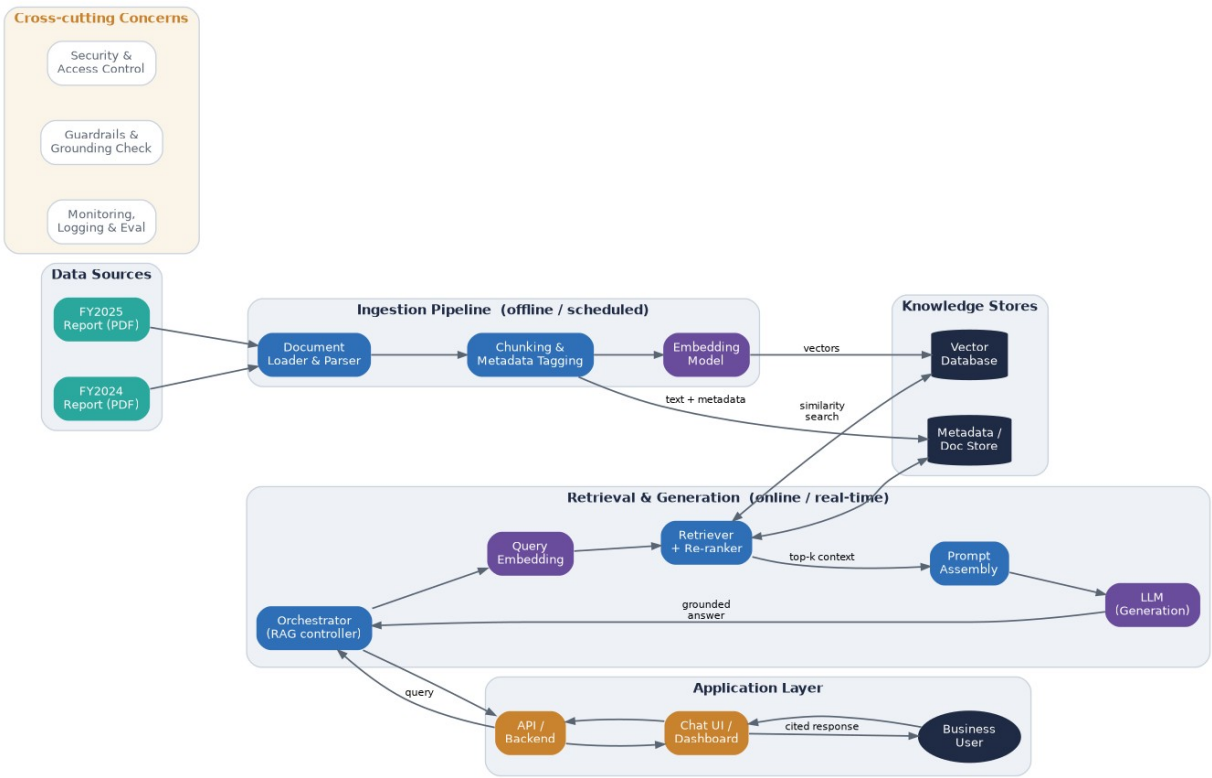

Figure 2. Technical architecture — RAG ingestion and retrieval/generation pipeline.

8.1 Component Responsibilities

Component	Responsibility
Document Loader & Parser	Read PDFs; extract text, tables, and structure.
Chunking & Metadata	Split content into passages; tag year, section, and source.
Embedding Model	Convert text and queries into vector representations.
Vector Database	Store embeddings and perform similarity search.
Metadata / Doc Store	Hold original text and citation metadata.
Orchestrator	Coordinate the retrieval-and-generation workflow.
Retriever + Re-ranker	Fetch and re-order the most relevant passages (top-k).
Prompt Assembly	Combine query, context, and instructions for the LLM.
LLM (Generation)	Produce the grounded, cited natural-language answer.
API & Chat UI	Expose the service and present answers to users.

9. Data Requirements

- **Source data —** FY2024 and FY2025 annual business report PDFs (text, tables, KPIs).
- **Metadata —** Company name, fiscal year, section heading, page reference.
- **Retention —** Indexed content and query logs retained per data-governance policy.
- **Quality —** Parsing must preserve numeric values and table relationships accurately.

10. Assumptions & Constraints

10.1 Assumptions

- • Source PDFs are text-based (not scanned images) and well-structured.
- • An approved embedding model and LLM are available for use.

- • Users have authenticated access to the application.

10.2 Constraints

- • The system must only answer from the indexed knowledge base, not external sources.
- • All processing must comply with the organisation’s data-security policies.
- • Initial release is limited to English-language reports.

11. Risks & Mitigations

Risk	Likelihood	Mitigation
Model generates unsupported answers (hallucination)	Medium	Grounding guardrails; require citations; refuse if no source.
Inaccurate table/number extraction	Medium	Robust parsing; validation checks on numeric fields.
Unauthorised data access	Low	Role-based access control and encryption.
Knowledge base becomes stale	Medium	Scheduled re-ingestion when new reports are added.

12. Acceptance Criteria

- • Both FY2024 and FY2025 reports are successfully ingested and queryable.
- • Factual questions return correct figures with valid source citations.
- • Year-over-year comparison questions return accurate results.
- • The system declines to answer when no supporting source is found.
- • Non-functional targets (latency, availability, security) are met.
